 **MorganMMS**
Innovating tomorrow's solutions . . . today

Table of Contents

Morgan Molten Metal Systems' foundry consumables are manufactured from premium quality materials. They are used in all areas of the modern foundry industry for temperature measurement, cleaning molten metal, control of chemical composition, degassing, and molten metal management.

Modern manufacturing technology, allied to the rigorous application of Quality Assurance procedures approved to ISO 9001, results in a wide range of foundry products suitable for all foundry applications.

MORCEM 2 is a two part, thermally conductive, high performance cement, specially developed by Morgan Molten Metal Systems (MorganMMS) for use in applications that have contact with liquid metals and slags. When mixed, a chemical hardening takes place, which does not need any additional drying or heating. There is a slight expansion and the hardened cement reaches a very high mechanical strength. It is suitable for use in applications where the temperature does not exceed 1650°C.

MORCEM 2 cement is supplied in two parts, MCM2 a dry powder and MCM3 a liquid component.

ADVANTAGES:

- Quick preparation of only a few minutes.
- Cold setting without drying and heating.
- Slight expansion of 1 %.
- Very strong crushing strength.
- Very high refractory.
- Very high thermal conductivity.
- Is not wetted by molten metals.
- Is not wetted by liquid slags.
- Very high resistance to erosion by molten metals.
- Very high resistance to erosion by liquid slags.
- Very high resistance to corrosive atmospheres.
- Is compatible with all standard refractory coatings.

Preparation of MORCEM 2 cement:

1. Ensure that the surfaces where MORCEM 2 cement will be applied are dry and free from any dust or solid particles.
2. Place the MORCEM MCM3 in a suitable plastic container.
3. Brush a coating of MCM3 onto the surfaces to be joined. This will accelerate the chemical setting of MORCEM 2 cement.
4. Mix the MCM2 powder with the liquid MCM3 left. The use of an electric mixer fitted with a centrifugal turbine wheel is recommended. (Rotation speed of 1000 rev/minute, to obtain a good mixture of MCM2 and MCM3).
5. The MORCEM 2 cement is now ready to use. Use the cement immediately.
6. Cold setting of the MORCEM 2 cement begins as soon as the mixture is ready. Use within 10 minutes of mixing for best results.
7. Keep the cement dry and vibration free for 24 hours to ensure maximum strength and properties.
8. MORCEM 2 cement can be used without drying or preheating.

Use of MORCEM 2 cement:

MORCEM 2 cement can be used in many applications, especially in the iron and steel industry, non-ferrous and ceramic. MORCEM 2 cement can be used in specific applications such as:

Jointing refractory / refractory

Refractory / metal

Metal / metal in some situations

Coating for old refractories.

To protect refractory pieces against molten metals and fluxes attack

To protect refractory pieces against oxidation (graphite pieces)

Sticking of refractories to metal. (Sealing of thermocouple sheaths to steel tubes)

Refractories to refractories

Refractories to ceramics

Fibres to metal

Coating by brushing or spraying on refractories, iron and steel

MCM3 can be used alone, for this application; (gas firing is necessary to obtain a superficial hardening)

Composition of MORCEM 2 cement before cold setting

Composition Before Cold Setting		
	Dry Powder	Wet Mix
SiC	43-45%	30%
Si	19-20%	13%
Al ₂ O ₃	14-15%	10-15%
SiO ₂	11-12%	8%
Alkali	2%	1.5%
P ₂ O ₅	-	20-30%
	+ferrous and titanium oxides	+ferrous and titanium oxides

Packing

MORCEM MCM2 cement is supplied in watertight plastic bags and the MORCEM MCM3 liquid hardener in plastic drums.

Packing		
	Packing No 1	Packing No 2
Morcem MCM2 Cement	15 Kgs	5 Kgs
Morcem MCM3 Liquid	4.5 Litre	1.5 Litre

Typical conductivity values: 0.020 – 0.023 cal/cm/co/sec

Morcem 900 is a high quality carbonaceous refractory cement which is supplied dry and merely requires mixing with water to be ready for use. It is extensively used in foundries and steelworks for many applications associated with jointing carbon or graphite based materials, and can also be used for providing a protective coating for refractories in contact with molten metal.

WORKING INSTRUCTIONS FOR MORCEM 900

Mixing

The material readily lends itself to mixing manually in any convenient container. Water should always be added to the powder, the amount being dependent upon the intended application. As a general guide when the material is to be used as cement, water should be added to the material in the ratio of 1:4 by volume. Where it is essential to obtain a strong air set joint prior to firing, the material must be mixed with boiling water but where green strength is not important cold water may be used.

Jointing

The surfaces to be joined should be brushed or blown free of dust and then 'wetted' but not soaked. This is particularly important where porous and unglazed surfaces are to be cemented. A thin layer of cement is then applied to both surfaces and the pieces squeezed together. Excess material which has exuded from the joint should be removed and the cement allowed to set. Care should be exercised in preventing the jointed parts from moving during the air setting period. This will vary from 1/2 hour, for material mixed with hot water, to several hours for material mixed with cold water.

Drying

It is dangerous to permit molten metal to come into contact with any refractory material which has not been thoroughly dried, therefore cemented articles must be subject to a drying procedure. Ideally, where time and facilities are available, the cemented assemblies should be left to air dry overnight and then moderate heat applied in an oven or with a gas torch until quite dry. Less effective alternatives are to dry the joint with a gas torch immediately or stand the pieces in a warm place for a prolonged period. Whichever method is adopted, the first heating of the joint to 'red heat' should be done as slowly as possible.

Firing

The joint only attains its maximum strength after firing to temperatures of approximately 1200°C. Therefore, care should be taken not to stress the joint until this temperature has been reached.

Cold Crushing Strength Measured on 25mm Cube				
Dried to	100°C	600°C	1000°C	1200°C
kg/cm ²	123	125	179	506
P.S.I	1750	1820	2540	7251

Nominal Chemical Analysis			
	%		%
SiO ₂	15	FE ₂ O ₃	6
SiC	30	B ₂ O ₃	1.5
C	29	Na ₂ O	0.4
Si	13	K ₂ O	0.3
Al ₂ O ₃	4	MgO	0.2
		CaO	0.6

Properties

Morcem 900 is a plumbago based material with added silicon carbide, providing a high strength refractory cement with excellent resistance to oxidation, metal penetration and slag attack. To achieve optimum results the material must be mixed and applied according to the 'Working Instructions'.

The following figures are based on average data obtained from current production quality control tests on the material.

Storage

It is recommended that the material is stored in a cool, dry place and that part used sacks are resealed to prevent moisture pick up.

Morcem 900 is a stock item and is supplied in 25kg paper sacks (Morcem 900D) and 7kg plastic buckets (Morcem 900E).

HIGH THERMAL CONDUCTIVITY RAMMING FOR ELECTRIC ARC FURNACE APPLICATIONS

INTRODUCTION

Morram 8301 (MRM8301A) is a high conductivity ramming material manufactured from carefully controlled blends of natural flake graphite (for thermal conductivity), and clays (for rammability and refractoriness). It has an excellent shelf life (18 months recommended) provided the bags remain sealed and protected from extremes of temperature. Morram 8301 must not be allowed to freeze and should be stored above 5°C.

INSTALLATION

Morram 8301 is supplied ready for use with a moisture content of 12-14%, requires no mixing or heating prior to use and can be installed easily using hand or pneumatic rammers. As a guide, Morram 8301 should be rammed until thumb pressure produces no more than slight indentation. To ensure even compaction throughout, it is recommended that the depth of loose material to be rammed at any one time should not exceed 150mm.

As far as possible, the ramming tool should move in a direction at right angles to the required direction of heat flow thus ensuring maximum cooling effect.

APPLICATIONS

The wear of refractory linings, in electric arc furnaces, increases as operating temperatures rise. In recognition of this, many furnaces are fitted with a cooling system, the efficiency of which is inhibited by the use of conventional low thermal conductivity refractories. Morram 8301 has been designed to improve the heat exchange between brickwork and the furnace cooling system and thereby extend the lining life and furnace campaign. Morram 8301 is recommended for use in the furnace bottom and the furnace side walls.

ADVANTAGES

- The thermal conductivity of Morram 8301 is at least twice that of conventional high conductivity ramming material.
- The thermal conductivity is maintained even at low rammed densities.
- High thermal conductivity is maintained at working temperatures.
- Easy to install – Morram 8301 is poured straight from the bag and is easily consolidated by hand ramming.
- No heating or other preparation is needed prior to installation.
- Ramming produces marked directional heat flow properties.
- Heat flow may be directed to the cooling system.
- Morram 8301 may be used as a compressible ramming to take up brickwork expansion.
- Good shelf life – (18 months providing the bags remain sealed and undamaged and protected from extremes of temperature). Morram 8301 must not be allowed to freeze and should be stored above 5°C.

HIGH THERMAL CONDUCTIVITY RAMMING FOR ELECTRIC ARC FURNACE APPLICATIONS

EFFECT OF TEMPERATURE

The thermal conductivity of Morram 8301 increases as the rammed density rises but for a given density, it is substantially constant.

PHYSICAL PROPERTIES

The thermal conductivity of Morram 8301 is higher than other conventional rammings over a wide range of rammed densities.

Thermal Conductivity			
Density (g/cc)	Thermal Conductivity (W/mK)		
	50°C	150°C	250°C
1.85	-	31.0	-
1.75	27	27.9	27
1.45	12.7	14.89	15.82

Chemical Analysis % by Weight			
Carbon	60-70	Al ₂ O ₃	9-13
SiO ₂	15-20	Fe ₂ O ₃	2 max

Warning: This material must be completely dry before molten metal is allowed to contact. To do otherwise is dangerous. This material should only be used for the purposes described or recommended.

PD Coating is a high purity, high alumina coating which is sintered onto the internal surface of the crucible during the manufacturing process. As a result of this process a dense physical barrier is formed which can enhance performance and extend crucible life when used in a range of applications.

FEATURES

- Flux Absorption
- Prevention of dross adhesion
- Prevention of contamination of the melt by crucible body material
- Wear resistance

TYPICAL APPLICATIONS

- Aluminium alloys (particularly effective at preventing attack on crucible body by aggressive modifying agents such as sodium, sodium salts, strontium).
- Zinc distillation and zinc oxide production
- Precious metals

Note:

PD Coating can be supplied on any of the carbon bonded silicon carbide or clay graphite crucibles manufactured by Morgan Molten Metal Systems.

PRO Coating is a thin covering that can be used on crucibles to significantly reduce impurities when melting and holding pure alloys. It also stops dross build up and makes clean up easy.

PREHEATING/FIRST USE

PRO Coating does not impact or change in any way the installation or startup / heating procedures for the crucible in which it has been applied.

APPLICATION

PRO Coating can be mixed with water and applied to the crucible with a brush.

It can also be used as a mortar to repair areas that may have been damaged or chipped.

TECHNICAL DATA

Primary material: Sintered Alumina

The coating is chemically bonded.

Shelf life: 6 months

Maximum temperature: 1600°C

HOW TO USE

To ensure the highest purity of the metal to be melted and to prohibit the build up of dross, a thin layer of PRO Coating should be applied after every charge.

Internal Crucible Lifter

Crucible Lifter

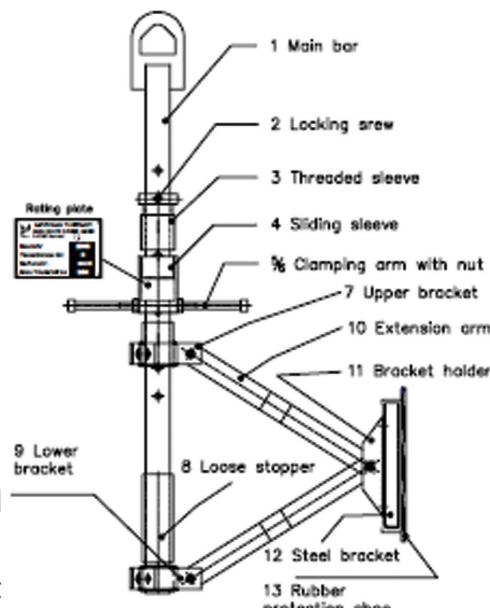

ADVANTAGES

- Easy handling - Allows for quick and easy movement of crucibles without removing the furnace top cover.
- Economical
- Crucible can be lifted through top opening without removing the furnace top cover, reducing down-time and saving valuable man hours
- Prevents damage to heater panels and eliminates costly repairs, as furnace top can be left in place.
- Carries CE mark for safety

	Minimum In-side Diameter (mm)	Maximum In-side Diameter (mm)	Maximum Lift-ing Capacity (kg)
Size 1	350	600	175
Size 2	580	740	300
Size 3	720	840	500
Size 4	820	1000	700
Size 5	940	1070	1000

1. Assemble the lifter to the crucible in such a way, that all 3 clamps have the same distance from the crucible top.
2. Move the sliding sleeve pos. 4 until the next free drilling and secure it there with the locking screw pos. 2.
3. Turn the sliding sleeve pos. 4 manually until all 3 clamps suit at the crucible.
4. The sliding sleeve can be manually tighten close over the clamping arm.
5. Avoid for safety reasons any jerky lifting movements.
6. Turn the sliding sleeve pos. 4 to the top after use, in order to protect the thread from getting dirty.
7. The thread should be controlled regularly to be easy movable and should the situation arise dope it with graphite powder.

**ATTENTION STRICTLY FORBIDDEN: DO NOT STAND UNDER OR NEAR A SUSPENDED LOAD!
WHEN LIFTING USED CRUCIBLES OUT OF THE FURNACE, GREAT CARE MUST BE TAKEN TO
AVOID ANY BURST OUT OF THE CRUCIBLE. USE THE CRUCIBLE LIFTER FOR TRANSPORTING
THE CRUCIBLE ONLY IN THE IMMEDIATE FRONT AREA OF THE FURNACE TO ELIMINATE ANY
SAFETY HAZARDS (INSTALLATION AND DEMOUNTING).**

SiC Degassing Rotors

Degassing

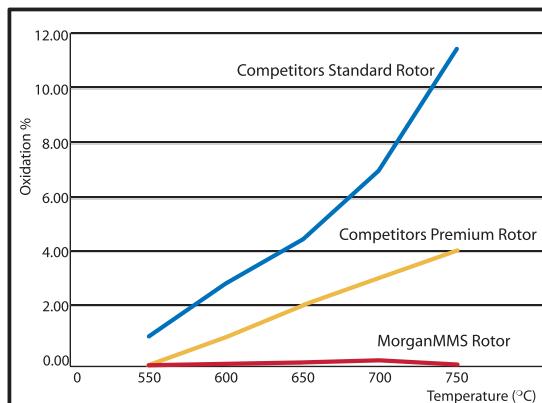

One of the major concerns in the modern aluminum casting industry is aluminum alloy cleanliness. With the ever increasing demands for improved casting properties, the requirements for molten metal cleanliness has become extremely stringent. The removal of dissolved hydrogen and unwanted particles from the melt using rotary degassing has become a widely used foundry practice.

MorganMMS has developed a one piece silicon carbide rotor and shaft for use in this process. The MorganMMS rotary degassing rotor has a high resistance to wear in service and has excellent anti oxidation properties providing a cost effective consumable for use in foundries' degassing processes.

MorganMMS' degassing rotor can be supplied in a range of sizes to suit customer's applications.

FEATURES

- One piece shaft and rotor
- Wear resistant silicon carbide material
- Excellent oxidation resistance
- Rotor designed for good gas dispersal
- Six vane rotor to reduce bubble size for better hydrogen removal

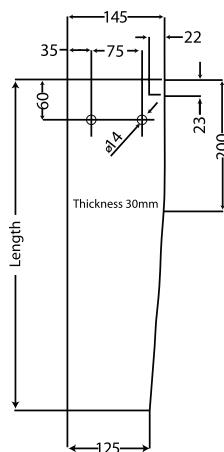

ADVANTAGES

- Efficient removal of hydrogen and unwanted particles
- Quick changeover of rotor
- One piece construction
- Long life
- Cost effective

Tests show significantly lower oxidation levels at operating temperatures for the MorganMMS silicon carbide rotor than for leading competitive products in other materials.

The MorganMMS degassing rotor is currently available with a rotor diameter of 150mm in lengths up to 1200mm to suit customer requirements.

Reference Number	Length
1580388	420
1580395	450
1580400	500
1580510	650

ANTI VORTEX PLATE

To complement our degassing rotor, MorganMMS also produces a clay graphite anti vortex plate. This plate is manufactured in a proven wear and oxidation resistant material. It will help stop the reintroduction of hydrogen and aluminium oxide particles into the treated molten aluminium by reducing the circular metal flow caused by the rotation of the degassing rotor.

Degassing Tubes

Degassing

A simple and convenient tool specifically designed to meet the requirements of refiners and foundrymen for nitrogen degassing.

Flushing the molten metal with nitrogen is a simple and inexpensive way to ensure that the melt is gas-free and helps ensure against gas porosity.

Ladle Bowls

Metal Sampling and Casting

The best method of taking molten metal samples and for skimming slag from induction furnaces and ladles. The products are supplied in a range of sizes from 275 cm³ to 2000 cm³ capacity. Designed for obtaining samples for spectrographic analysis, test bars and thermal analysis samples. Molten metal samples can be retrieved in a cost efficient way, free from contamination of dirt, which is close to temperature of the bulk metal being sampled (important for thermal analysis).

+GF+ Converter Segments

Metal Sampling and Casting

MorganMMS' +GF+ converter segments offer an economic alternative consumable for foundries converting cast iron to ductile iron using the George Fischer process. Produced in clay graphite under quality controlled conditions, MorganMMS' converter segments can be manufactured in a range of sizes to suit customers' requirements.

APPLICATION

The segments are placed in the bottom of the George Fischer converter vessel to form a chamber into which the magnesium is introduced from outside the vessel. When the vessel is rotated, the molten iron is introduced into the chamber in a controlled manner through the holes in the clay graphite segment. The magnesium is then vaporised by the iron and desulphurises and nodularises the cast iron, producing ductile cast iron.

MorganMMS reserve the right to change specifications at any time.

Downspouts

Metal Transfer

Clay graphite down spouts are used to regulate the flow of the molten metal in the continuous casting of copper bar. These can be supplied to customers own design to suit the application.

Filling Funnels

Metal Transfer

Filling funnels are used in aluminium dosing furnaces to allow the furnace to be filled with molten metal without interrupting production.

PATTERN	PART DESCRIPTION	TOP DIAMETER (mm)	BTM. DIAMETER (mm)	HEIGHT (mm)	HOLE DIA. (mm)	COMMENTS	APPLICATION METAL	APPLICATION TEMP. Degrees °C

Launders

Metal Transfer

Pre-fired shapes for the transfer of ferrous and non-ferrous metals from furnace to furnace or from furnace to ladle. Launders provide a metal transfer system that has a high resistance to erosion and is virtually maintenance-free when installed properly. Available in many sizes to suit most runner systems. Also suitable for use as spouts in "teapot" spout casting ladles.

Stoppers

Metal Transfer

A complete range of Salamander Plumbago™ stoppers for bottom pour ladles is available in a range of sizes and designs. MorganMMS stopper rod ends are used by attaching to a steel rod, which is sheathed with refractory tubes for protection from the molten metal.

Our stoppers do not stick to the ladle nozzle when lifted and consistently reseal without leaks when closed off.

Stoppers

Metal Transfer

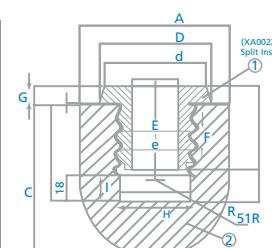

A complete range of Salamander stoppers for bottom pour ladles is available in a range of sizes and designs.

Due to the properties of Salamander these stoppers provide an efficient, cost effective seal on the ladle nozzle.

OTHER: 5 - 10%

Tiles

Metal Transfer

A limited range of shapes and sizes can be cut from prefired blocks of clay graphite to form bricks and tiles. Clay Graphite bricks are used for tap hole surrounds and linings in Blast furnaces.

Tiles are used to stop erosion and slag attack in ladles and furnaces.

Tiles can also be used for removing slag from furnaces and ladles.

ISO Stat - SC Pyrometer Protection Sheaths

Pyrometry

Consistent temperature control is a pre-requisite for today's light alloy foundry if correct metallurgical conditions are to be maintained.

MorganMMS' ISO Stat-SC Isostatically pressed Silicon Carbide pyrometer protection sheaths, with built in body glaze, provide a durable and cost effective solution for every aluminum casting process.

Pyrometer Sheaths

Pyrometry

MorganMMS pyrometer sheaths offer an economic system for the measurement of liquid metal temperature. They provide accuracy and good response and are available for both floating and fixed installations in a range of sizes to suit most applications.

Rods

Skimming and Additions

Clay Graphite rods can be used for stirring additions into all types of molten metal ensuring good distribution of the additions in the melt.

Skimmers

Skimming and Additions

Clay Graphite skimmers are designed for the easy and efficient removal of dross and dirt from all types of molten metal. They are supplied with a threaded bolt for easy attachment to a handle and have holes for the draining of molten metal back into the furnace, reducing waste.

PATTERN	PART DESCRIPTION	DIAMETER (mm)	LENGTH (mm)	CAPACITY (cc)	COMMENTS	APP METAL	BOLT THREAD	DRAIN HOLES	APPLICATION TEMP. Degrees °C

Stirrers

Skimming and Additions

Clay Graphite stirrers can be used for mixing additions into all types of molten metal, ensuring good distribution of the additions in the melt. They can also be used to remove any dirt or oxides from the surface of the molten metal.
